

Account Leakage Scenario

1. Hacker tries unsuccessfully to **breach** your network
2. Hacker scans the internet for **compromised** sites and credentials
3. Hacker finds a set of **stolen credentials** for John Smith (JSmith@yourcompany.com)
4. Hacker uses **stolen credentials** to authenticate to your VPN service and has full, trusted access to your internal network

Note: Users tend to use a common email account for multiple other web services such as social networking, forums, etc. Many times the email address they use is their work address. Unfortunately history has proven that users tend to use the same or a slight deviation of their password across multiple websites and services.

This common use of credentials could leave your corporate network open for attack should one of the websites becomes compromised.

Contact **Total Resilience** today to receive your free Domain Account Leakage Report and take the first step towards resilience.
